

**$\Delta T$  FROM PHOTOELECTRIC OBSERVATIONS OF OCCULTATIONS  
IN JAPAN FOR 1955 TO 1959**

Hirokazu Suzuki and Yukio Harada

*Received 31 August, 1967*

**Abstract**

Data of photoelectric observations of occultation made at the Tokyo Astronomical Observatory and the Hydrographic Office for the years of 1955 to 1959 are combined together, and re-reductions are made employing the Improved Lunar Ephemeris, limb corrections by Watts' profile, International ellipsoid, and corrections  $\Delta\varphi = +10''$ ,  $\Delta\lambda = +20''$  to the geodetic datum of Japan.

$\Delta T_O$ 's are evaluated for middle of each year, and combined with provisional values of  $\Delta T_O$  for 1960 to 1966. These  $\Delta T_O$ 's agree well with those of Washington meridian observations in rate as well as in absolute value. Comparison of provisional values of  $\Delta T_1$  with AT-UT2 suggests necessity of research on the adopted frequency of caesium standard in one ephemeris second.

**1. Introduction**

Observation of occultation by the moon is one of the effective means for practical determination on  $\Delta T = ET - UT$ . Photoelectric method of occultation observation was devised by Hirose (1949) and Osawa (1949, 1950) of the Tokyo Astronomical Observatory, and has been made as routine at the observatory since 1950 and at the Hydrographic Office since 1953. Their observational data and results of reduction have been published from the respective institutes, as shown in Table 1.

Because of superior accuracy, it seems worthwhile to combine these photoelectric data in a single list and to re-reduce them employing a unified system, i.e. ephemeris of the moon, correction to the moon's limb, reference earth spheroid and correction to the geodetic datum. As a first step, the present paper treats occultation of NZC-stars for 1955 to 1959.

**2. Data of Observation and Reduction**

Table 2 lists the observing stations. They consist of four groups, i.e.

Nos. 1 to 7: fixed stations of HO,

Nos. 11 to 13: temporary stations of HO,

Nos. 101 to 103: fixed stations of TAO,

Nos. 111 to 120: temporary stations of TAO.

Geodetic coordinates refer to the International ellipsoid. Provisional corrections of  $+10''$  in latitude and  $+20''$  in longitude are applied to the geodetic datum of Japan.

Table 3. shows data of observation and reduction. UT2 in the 8th column of left-hand page is taken from original records of observation of HO or the published reports of TAO. For reduction the Improved Lunar Ephemeris is employed. Limb corrections  $h$ , in the 10th column of right-hand page, is made with the moon's profile by Watts (1963), values of libration, in the 7th to 9th columns, being taken from the British Nautical Almanac. Then, values of  $\Delta\sigma - h$  in the last column are applied to analysis.

### 3. Analysis and Discussion

$\Delta T_O$  and  $\Delta B$  for each year are evaluated by the method of least squares employing the observation equations:

$$p_1(a+bt)+q(c+dt)=\Delta\sigma-h.$$

$t$  is reckoned from the middle of each year in unit of year, then  $a$  and  $c$  denote  $\Delta T$  and  $\Delta B$  at the middle of the year, respectively. And

$$p_1=\cos(\chi-\rho)\sqrt{(15\Delta\alpha_i \cos\delta_i)^2 + (\Delta\delta_i)^2}/3600,$$

$$q=-\sin(\chi-\rho),$$

where  $\Delta\alpha_i$  and  $\Delta\delta_i$  are hourly changes of the moon's position. Data with  $\Delta\sigma-h \geq 2''$  are not adopted to the analysis. Solutions are listed in Table 4.

At first, HO- and TAO-observations are solved separately, as shown in Tables 4a and 4b. There seems to exist no systematic difference between them. Furhter, the authors have once evaluated  $\Delta T$ 's and  $\Delta B$ 's for TAO-data of 1960 to 1962, except for the observations made at temporary stations. Some of these occultations were observed simultaneously at HO-stations. In Table 5 solutions for these simultaneous observations are given. We find no systematic difference between HO- and TAO-observations. Then, they can be combined together to evaluate  $\Delta T$  and  $\Delta B$ . Results are shown in Table 4c.

Yamazaki has evaluated  $\Delta T_O$ 's and  $\Delta B$ 's from the HO-data for 1960 to 1966, and authors have evaluated for most of the TAO-data of 1960 to 1962. We make weighted means of these HO- and TAO-values for 1960 to 1962.

Values of  $\Delta T_O$  thus obtained are shown in the second column of Table 6. In the third column of the table are given  $\Delta T_O$ 's from meridian observation of the moon at the U.S. Naval Observatory, Washington, D.C. (Adams and Scott, 1964, 1965a, 1965b, 1967).

TABLE 5. COMPARISON FOR COMMON OCCULTATIONS

	TAO				HO			
	N	$\Delta T_O$ p.e.	$\Delta B$ p.e.	N	$\Delta T_O$ p.e.	$\Delta B$ p.e.		
1960. 5	12	+31.77 ± 0.23	-0.15 ± 0.13	17	+31.47 ± 0.17	-0.05 ± 0.11		
1961. 5	15	32.00 .18	+ .23 .14	19	32.00 .36	+ .56 .29		
1962. 5	9	32.21 .19	-.25 .18	11	32.82 .14	-.42 .13		

Improved Lunar Ephemeris, Watts' limb correction, International Ellipsoid, and Datum corr.  $\Delta\varphi = +10''$ ,  $\Delta\lambda = +20''$  are employed.

Approximate values of  $\Delta T_1$  for the middle of each year are obtained through

$$\begin{aligned}\Delta T_1 - \Delta T_O &= -1.8214 \lambda \\ &= +0.344 \sin \Omega - 0.131 \sin (2\Gamma' - 2\Omega),\end{aligned}$$

ignoring the term in  $\sin D$ . Values of  $\sin \Omega$  in the present approximation is that at the middle of the year, and  $\sin (2\Gamma' - 2\Omega)$  is integrated through the year.  $\Delta T_1$ 's of Japan occultation are shown in the fourth column of Table 6, and ( $\Delta T$ -UT2)'s by BIH are in the fifth column. In Fig. 1  $\Delta T_1$  of Japan occultation and AT-UT2 are shown.

Difference in  $\Delta T_O$  between Japan occultation and Washington meridian is shown in Fig. 2 and is expressed by

$$\begin{aligned}\Delta T_J - \Delta T_W &= -0.03 + 0.02 t, \\ &\quad \pm .06 \pm .02 \text{ (p.e.)}\end{aligned}$$

where  $t$  reckoned from 1960.0 in unit of year. We find that  $\Delta T_O$  of Japan occultation is very close to that of Washington meridian in timely rate as well as in absolute value.

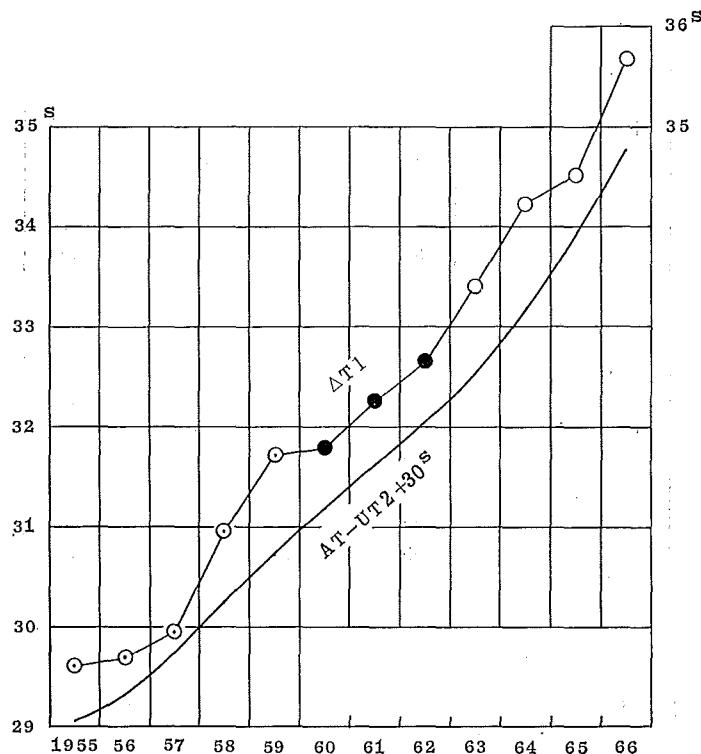

Fig. 1

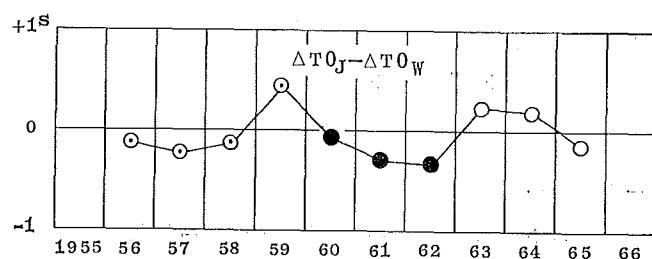

Fig. 2

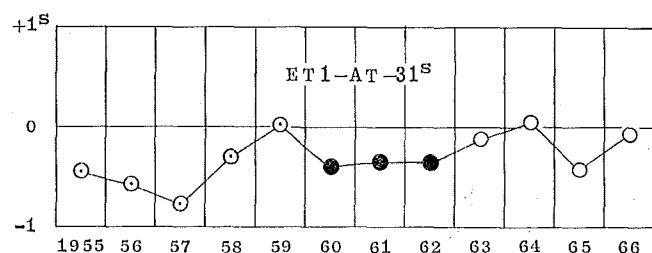

Fig. 3

TABLE 6. COMPARISON OF UT, ET AND AT

	$\Delta T O_J$	$\Delta T O_W$	$\Delta T I_J$	AT-UT2
1955. 5	+29.90	s	+29.60	-0.96
1956. 5	30.12	+30.24	29.70	-0.69
1957. 5	30.16	30.39	29.97	-0.27
1958. 5	31.06	31.17	30.95	+0.25
1959. 5	31.89	31.45	31.73	+0.71
1960. 5	31.67	31.76	31.80	+1.18
1961. 5	32.04	32.31	32.26	+1.60
1962. 5	32.54	32.88	32.69	+2.04
1963. 5	33.03	32.80	33.41	+2.53
1964. 5	33.85	33.67	34.24	+3.20
1965. 5	34.30	34.45	34.52	+3.95
1966. 5	35.34		35.68	+4.80

Difference between ET1 from Japan occultation and AT of BIH is shown in Fig. 3 and is expressed by

$$\Delta E_J A = ET1_J - AT = 30.659 + 0.036 t.$$

$$\pm .044 \pm .012$$

Further,  $\Delta T O$  of Washington meridian is reduced to  $\Delta T I$  by same process as for Japan occultation, and difference between this ET1 of Washington meridian and AT of BIH is expressed by

$$\Delta E_W A = ET1_W - AT = 30.671 + 0.036 t.$$

$$\pm .030 \pm .011$$

Remarkable agreement between  $\Delta E_J A$  and  $\Delta E_W A$  in the coefficient of linear term confirms the agreement of  $\Delta T$ 's of Japan occultation with those of Washington meridian, and suggests the necessity of researches on the adopted value of caesium frequency standard in one ephemeris second.

Authors wish to thank Dr. A. M. Sinzi for his advice.
